

50 years of passwords, time to wave goodbye

Hitachi's **VeinID Five** gives you an efficient, easy and fast security access.

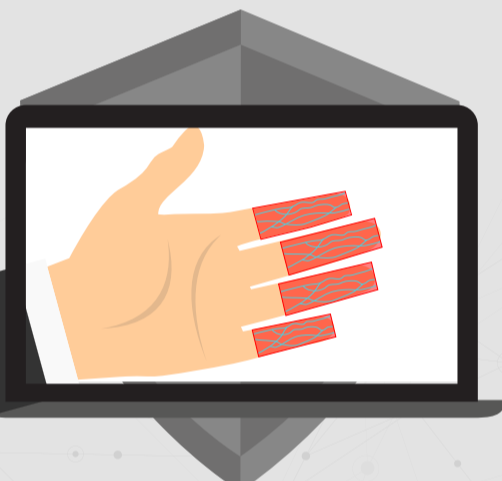

Passwords are starting to fail us; with password breach continuing to account for over **eighty percent** of all intrusions.

How do we give users a **better experience** and reduce the risk of breach or compromise?

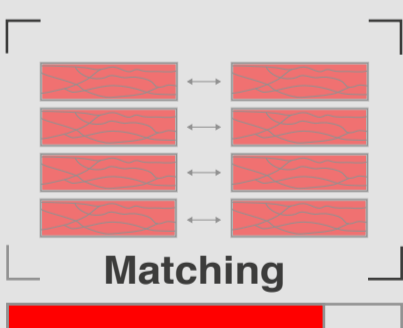

Introducing VeinID Five

A biometric that uses standard equipment and provides a class leading level of security.

VeinID Five is able to biometrically authenticate you, by utilising the **ambient light spectrum** to highlight the vein pattern within your fingers, **VeinID Five** captures the pattern through a **standard laptop camera** which then grants you access.

The user raises their hand and **VeinID Five** captures the **vein pattern** through a **standard laptop or mobile phone camera**.

It is then **processed** and **matched** against the registered profile, authenticating them in **less than 5 seconds**.

This provides a superior user experience, where users always have the **'method on them'**, removing the need to continually remember and input passwords.
